

I vehemently oppose this measure! The logistics of allowing government wiretapping of TCP/IP connections to people's homes is prohibitively complex and expensive. Furthermore, the emergence of IPv6, the new world-wide Internet standard, invalidates any such attempts by its very nature. Anyone with even a basic understanding of Internet routing and traffic flow can tell you how ridiculous this entire proposition is. This will potentially drive ISPs out of business, retard consumer broadband adoption, and unnecessarily infringe on a citizen's right to privacy. The FCC needs to talk to some leading Internet experts and get some informed and educated input.
